

# How to Determine If You Have Plumbing Leaks

*Your water meter is equipped with a low flow detection device.*

*You can easily determine if you have any plumbing leaks by shutting off all the fixtures and faucets in your home.*

*Lift the black cover of your water meter, and look at the meter face. Just below and to the left of the “odometer” there is a black 6 point star. (See Photo Above). This is the low flow indicator.*

*If the star is spinning when all fixtures and faucets are shut off, then you may have a problem such as a leaking toilet, dripping faucet, irrigation line leak, etc.*
